“High Quality Japanese Translations for Popular Cardano DApps”

Slide 1

Introduction

Hello, Cardano community! I'm Mladen Lamesevic from Anastasia Labs.

Today, I am pleased to present the closeout report for our Catalyst Fund 11 project titled: High Quality Japanese Translations for Popular Cardano DApps

Slide 2

Project Objective and Challenges

In this presentation, I'll cover why we embarked on this project, how we executed it, and the outcomes we achieved.

Japan has the biggest Cardano community in the world in terms of membership and in terms of ADA holdings and so many of them are very active. However, one of the issues that they are facing is that they have a huge language barrier. Many of the community members don't speak English, don't read English. That means there is isolation between Japan and Japanese community and the rest of the world.

Our project is a coproposal with Yuta, a community member from Japan and is aimed to reduce this barrier for Japanese ADA holders by providing translations to some of the popular Cardano DApps and thus reduces the risks associated with misinterpretations in DeFi transactions.

Slide 3

List of Cardano DApps Translated

The project successfully achieved professional, high-quality Japanese translations for the front-end interfaces of prominent Cardano DApps, specifically targeting DJED, Liqwid Finance, Lace Wallet, SundaeSwap, Minswap, OptimFi and Encoins. The Translations for each respective projects are available to public on our AnastasiaLabs Github repository. The projects can now integrate them on their websites.

Slide 4

Availability of Translations

Click on each link to show where each project's translation is available.

Slide 5

Community Impact

By enhancing accessibility for Japanese users, a key market, the project is expected to drive increased adoption and usage of Cardano DApps, contributing to long-term growth in transaction volumes and network value. Accurate translations also help mitigate risks associated with misinterpretation in DeFi transactions, potentially saving significant costs related to dispute resolution and user support. Additionally, investing in inclusivity and improving user experience strengthens Cardano's reputation as a globally accessible and user-centric platform, which can attract further investment and expand its user base. The approach and resources developed for Japanese translations also offer a scalable model that can be adapted for other languages in the future, broadening global accessibility and engagement.

Slide 6

Conclusion

In Conclusion, By directly addressing a community need, our project builds a sense of belonging and loyalty among users, which is invaluable for community-driven ecosystems like Cardano. We believe our work will inspire further innovation and drive adoption within the Cardano ecosystem. Thank you for your support and interest in our work.
